Providing added protection for passive packaging

As a result of a unique collaborative approach with insulation specialists, we are bringing a new offering to the airfreight industry: our innovative White Container.

The affordable White Container keeps your products cool during transportation without compromising safety, fuel burn, or regulatory approvals.

The White Container does not replace our high-end active containers but instead provides an intermediate temperature controlled solution ideal for generic healthcare products and food perishables.

Quick Facts about the White Container:

- The White Container is coated on the inside with thermal insulators, preventing the transfer of outside heat, especially during tarmac transportation.
- It uses coolant trays in standard LD3 containers, allowing handlers to add or replenish dry ice or other coolants without disturbing the shipment's packaging.
- It can be used for shipments requiring temperatures of 2°C – 8°C (COL) and for those needing 15°C – 25°C (CRT).

If you are interested in utilising our White Container solution for your shipping needs, please contact your local Emirates SkyCargo office.
